## What is Zopiclone?

**Zopiclone** is a non-benzodiazepine hypnotic medication used to treat short-term sleep disorders, primarily insomnia. Unlike traditional sleep medications, Zopiclone works by interacting with brain receptors to promote relaxation and improve sleep quality.

Key benefits of Zopiclone include:

- Helps you **fall asleep faster**
- Reduces **nighttime awakenings**
- Improves **overall sleep quality**
- Short-term solution for stress or jet lag-related insomnia

## How Does Zopiclone Work?

Zopiclone targets the **GABA receptors** in the brain, which play a crucial role in calming the nervous system. By enhancing the effects of GABA, Zopiclone helps the brain transition into a sleep state quickly and maintain uninterrupted rest.

Unlike other sleep medications, Zopiclone is considered effective for short-term use (typically 7–10 days) and is known for having fewer side effects when used responsibly.
